

# Update Strategy Transformation

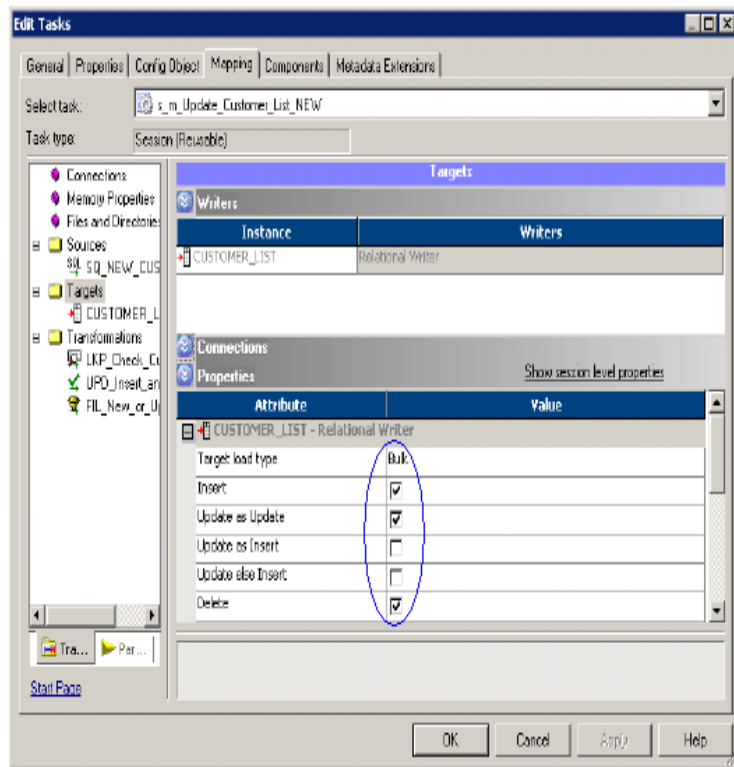

# Update Strategy Transformation

- Used to control how the rows are flagged for Insert, Update, Reject or Delete in a Mapping.
- To define the flagging of rows in a session, It can be Insert, Update, Delete or Data Driven. In Data Driven Option the Session follows the Flag specified in the Mapping's Update strategy.
- It can be configured to either Drop the Rejected rows or to forward it to next transformation, In the latter case, a separate Reject Table can be used

# Update Strategy Transformation (Contd.).

- The Control can be separately done for each of the targets in the mapping
- Update Strategy Options:
  - Insert - Inserts row into the table
  - Delete - Deletes row from the table
  - Update - Updates row existing in the table
- Target Table Update strategy Options:
  - Update as Update - Updates each row flagged for Update if it exists in the table
  - Update as Insert - Inserts a new row for each Update
  - Update else Insert - Updates if row exists, else Inserts

Thank You
